```
cc derived from the fibre forming regions of spider dragline protein,

Cc esp. the natural protein 1 (Spidroin 1) from Nephila clavipes. This

CDNA sequence may be used in the recombinant production of the

CC variant protein in a recombinant host, e.g. E. coli or Bacillus

CC variant protein in a recombinant host, e.g. E. coli or Bacillus

CC variant protein in a recombinant host, e.g. E. coli or Bacillus

CC variant protein in a recombinant host, e.g. E. coli or Bacillus

CC variant protein in a recombinant protein and the pattern

CC of variation among individual repeats. DP-1A analogues are composed

CC of a tandemly repeated 101 amino acid monomer which comprises four

CC repeats which differ from the consensus sequence given in AAM06201,

CC according to the pattern (1)-(5) given below. This 101 amino acid

CC monomer is repeated 1-16 times in a series of analogue proteins. The

CC individual repeats differ from the consensus according to the pattern:

CC (1) the poly-alanine sequence varies in length from 0-7

CC residues; (2) when the entire poly-alanine sequence is deleted,
                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                        ABL03846;
                                                                                                                                                                                                                                                                                                                                                                          ABL03846 standard; cDNA; 3251
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This is the nucleotide sequence encoding the lycopene cyclase enzyme from Erythrobacter longus ATCC 14126. The gene was isolated from an dehydrogenase genemic DNA library using a 1 kb fragment of the phytoene a nucleotide fragment which contained two open reading frames (ORF). (1302 bp) encodes the phytoene dehydrogenase (AAT31798) whereas ORF1 plasmid produces lycopene cyclase. The two ORFs were inserted into the Rhodobacter sphaeroides for produce of the proteins. The phytoene dehydrogenase and lycopene cyclase can be used to produce beta-carotine effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              900

                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB0737-ABB72072).
                                                                                                                                                                                                                                                                1279
                                                                                                                                                                                                                                                                                                                                                                                                             The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
